

Trauma & Orthopaedics

Discharge Advice - Wrist Soft Tissue Injury

You have sustained a soft tissue injury to your wrist with no bony injury identified at the time of your assessment.

- This type of injury can take up to four weeks to heal.
 - You may or may not have been provided with a wrist support for you to wear whilst using your arm.
 - If you have been provided with a wrist support, you should gradually reduce the use of the support as your pain settles and aim to remove it completely as soon as you feel able.
 - It is important to keep the wrist moving to prevent stiffness.
- We do not routinely follow up patients with this type of injury. However, if at six weeks you are still experiencing pain and swelling then please do not hesitate to contact us for further advice or see your GP.

Advice

Painkillers

You should have been advised about painkillers. We recommend that you take these regularly for the first few days both for your comfort and to enable you to move your wrist. It is important to keep gently moving your elbow, wrist and hand and gradually resume daily activities within the limits of discomfort. This will reduce stiffness and ensure the quickest return to normal function.

Patient Information

Exercises

Finger and wrist flexion and extension

Open and close the hand of your injured wrist 10-15 times.

Then move your wrist up and down 10-15 times.

Patient Information
